Constipation: what is it?

Constipation is the frequency of bowel movements that tends to differ across individuals, with several having them over formerly a day and several only occasionally.

Constipation is additionally characterized by:

- Your bowel is hard and dry.
- You have painful bowel movements and have distress passing stools.
- You feel as if you have not emptied your bowels.

How current is it?

If you have constipation, you're not alone. Constipation is one of the vast majority of current gastrointestinal complaints in the United States. Constipation is the main bring on of doctor visits for over 2.5 million nations each year.

Constipation can bear on a group of all ages. Furthermore, natives and situations are more doubtless to lead to chronic constipation ("chronic constipation"). Several of these include:

- **The elderly.** The older person tends to be active, have a slower metabolism, and have weaker muscle contractions along their digestive tract than younger.
- **Hormonal changes make women more prone to constipation.** The baby squishes the intestines, slowing the passage of stool.
- **Too much miniature high-fiber food.** Fiber assists keep meals moving through the digestive system. You may be taking positive medications (see causes).

It occurs when your colon absorbs too much water from waste (stool/poop), which causes the stool to become firm in consistency and firm to push out of your body.

As a meal passes through the digestive tract, nutrients are absorbed.

The digested meal (waste) passes from the intestine to the immense intestine, additionally titled the colon. The colon absorbs water from waste, which generated stool.

Constipation may bring on a meal to plod too slowly through the digestive system. The stool becomes hard, dry, and hard to push out.

The treatment

Without prescription treatment, constipation generally resolves on its own. The time, lifestyle changes – more exercise, consuming more fiber, and drinking more water – can help.

Allowing time for defecation without interruption or emphasis may additionally be beneficial. It's necessary not to disregard the advice to have a bowel movement.

Short-term laxatives can relieve symptoms, but several natives should only use them sparingly. Laxatives frequently bring on severe side effects.

A doctor may additionally test for underlying conditions.

Keeping track of bowel movements, stool characteristics, and dietary and other factors may assist work out proper treatment.

Prevention

You can don't chronic constipation by following these steps.

- Eat plenty of high-fiber foods, for example, beans, vegetables, fruits, complete grain cereals, and bran.
- Avoid processed foods, dairy products, and meat products that are low in fiber.
- Remain hydrated.
- Try to remain active and get exercise.
- Manage your stress.
- If you feel the advocate pass stool, don't disregard it.
- Maintain a schedule for bowel movements, mainly after eating.
- You require to make definite your child receives sufficient fiber in the diet as consuming solid food.

Constipation: 5 meals you have to eat

- **Potatoes**

3.8 grams of fiber are exhibit in one medium-baked kind of potato with skin. The fiber content material in kind potatoes assists prevents and alleviates constipation. You'll reap the vast majority of advantages from leaving the skin alone.

A limited baked potato contains 3 grams of fiber, production it an excellent source of fiber. Do not high-calorie toppings butter and sour cream and runoff the skin.
